Problem Statement: As a daily commuter, and many others, people lack the time to make decisions. This may include the food they want to eat, the attire they want to don, what they want to do that evening, and so on. Our goal is that by designing an app to address these daily challenges, we are able to effectively accommodate people who lack decision making skills, busy people with no time on their hands to ponder small decisions, and people who simply want to spice up their life a little.

Who is experiencing the problem?: Busy commuters, people who overthink decisions, people with subpar decision-making skills, and anyone who is bored and wants something to do.

What is the problem?: Daily decision making, over time, can become tedious and inconvenient. For productive people, it can steal time from their craft, and for overly relaxed people, it revokes time that can be spent relaxing.

Where does the problem present itself?: At home, during a lunch break, when people become famished, when you wake up in the morning, etc.

Why does it matter?: This problem is significant because, throughout our daily lives, people have been inconvenienced by the task of making decisions daily. Although a necessity of life, choosing a set of clothes and deciding what to eat everyday can become very irritating. Creating an app that completes that tedious task for you removes an obligation that vents more leisure time for you to spare.
